ABSTRACT

5 A work managing system for managing B-to-B work
wherein the reliability in control and the ease of
operation are remarkably improved over the past. For
this, the work managing system has a plurality of
different work executing sites 4 for executing work
assigned to them for an order received from an orderer 3
and a work control site 2 for instructing the progress of
10 work to the plurality of work executing sites 4 and
monitoring its progress while linking them with each
other, where the work control site 2 and the work
executing sites 4 exchange between those managing
information relating to the instructions and monitoring
15 of work through a communications network 5.
